2. Informations sur dispositif ou équipement

- 2.1 <u>Dénomination commune</u>: selon la nomenclature d'Europharmat®
- 2.2 <u>Dénomination commerciale</u>:

CATHETER PERIPHERIQUE INTRAVEINEUX

NEO DELTA VEN 1, NEO DELTA VEN T, NEO DELTA VEN 2

- 2.3 Code nomenclature: 10727
- 2.4 Code LPPR* (ex TIPS si applicable): Non applicable à ce produit (NA)

Code ACL* (ex CIP si applicable) : NA

2.5 Classe du DM : Classe IIa

Directive de l'UE applicable : 93/42/CE

Selon Annexe n°: Annexes V et VII Classification de l'appareil, selon l'article 7 de l'annexe

Numéro de l'organisme notifié : CE 0373

Date de première mise sur le marché dans l'UE : 11/2011

Fabricant du DM : DELTA SPA MED

Certificat applicable à l'entreprise fabricante : ISO 9001: 2008 et ISO 13485 : 2012

Organisme certificateur : Istituto Superiore di sanità

Normes applicable au dispositif médical :

EN ISO 13485 / EN ISO 10993 (norme harmonisée en plupart pièces)/ EN ISO 10993-7: 2009/ EN ISO 11737/ EN ISO 11138/ EN ISO 11135-1: 2008/ EN ISO 556:2002/ EN ISO 11607/ EN ISO 9626/ EN ISO 10555-1/ EN ISO 10555-5/ EN 1707/ EN 20594-1

Dossier d'information type Euro Pharmat

2.6

Descriptif du dispositif (avec photo, schéma, dimensions, volume, ...): peut être relié au point 8 :

Cathéter IV entrée unique sans ailette NEO DELTA VEN T

T

Aiguille Canule à une voie, sans ailettes et sans port d'Injection, disponible dans les mesures 146 à 269.

La mesure 260 est idéale pour les nouveau-nes.

Cathèters en polyuréthone (PUR), qui offie les avantages suivants:

Grande compatibilité avec les médicaments.

Grande biocompatibilité pour un long maintien en veine.

Grande flexibilité pour une adaptation ainée du cathéter à la veine.

Élasticité pour un retour rapide du catheter à sa forme d'origine avec

rétablissement consécutif du flux normal de perfusion en cas de mouvements

involontaires du patient qui provoquent une plure du catheter.

Surface lisse et acuple pour diminuer les risques de thromboses et de philibbles.

Insertion nisée.

Résistant aux plures.

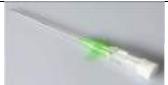

Devient encore plus souple avec to chateur du corps humain.

Caractéristriques générales du cathérer intraveineux

- · Affitage de l'aiguille de type "BACK-CUT".
- Efflage du catréter atraumatique.
- · Distance optimale entre la canule et la pointe de l'aiguille
- · Catheter à paroi fine avec 3 bandes rado-opaques.
- Chambre de visualisation transparente pour le contrôle immédiat du retour sanguin.
- Fifte microporeus amouble permetant une fermelure fiable, ce qui élimine les risques de contamination.
 Disponibilité du lissochor LUER LOCK pour la fermeture de la partie proximale du
- catheter après le retrat de l'alguille.
- Obturateurs à une voix disponitries pour toutes les mesures (sauf la 26G).

Cathéter IV entrée unique avec ailettes **NEO DELTA VEN 1**

Aiguille Canule à une voie avec allettes, sans port d'injection, d'aponible dans les mesures 140 à 260.

La mesure 260 est idéale pour les nouveau-nés

Cathéters en polyuréthone (PUR), qui offre les avantages suivants:

Grande compatibilité avec les médicaments.

Grande biocompatibilité pour un long maintien en veine.

Grande flexibilité pour une adaptation aixee du cathéter à la veine.

Élasticité pour un retour rapide du cathéter à sa forme d'origine avec

rétablissement consécutif du flux normal de perfusion en cas de mouvements

involontaires du patient qui provoquent une plure du cathéter

Surface lisse et souple pour diminuer les risques de thromboses et de phiétrites

Insertion aisée

Résistant aux plures.

Devient encore plus souple avec la chaleur du corps humain.

Caractéristiques générales du cathéter intravelneux:

- + Affütage de l'aiguille de type "BACK-CUT".
- Efflage du cathèter atraumatique
- · Distance optimale entre la canule et la pointe de l'aiguille.
- · Catheter a parol fine avec 3 bandes radio-opaques.
- . Chambre de visualisation transparente pour le contrôle immédial du retour
- Filtre microporeux amovibre permettant une fermeture flable, ce qui élimine les lisques de confamination. · Disponibilità du bouchon LUER LOCK pour la fernature de la partie proximale du
- catheter après le retrait de l'aiguite
- Obtursteurs à une voie disponibles pour toutes les mesures (sauf la 26G).

DISPOSITIF MEDICAL

2.6 <u>Descriptif du dispositif (avec photo, schéma, dimensions, volume, ...)</u>: peut être relié au point 8
Cathéter périphérique I.V. (aiguille canule), consistant en aiguille en acier inoxydable, cathéter en polyuréthane, avec ou sans dispositif sécurité et soupape d'injection sans Latex. Le cathéter veineux périphérique est couramment utilisé à l'hôpital et en deh<u>ors du milieu hospitalier pour permettre l'accès veineux en peu de temps</u>.

<u>Durée de contact</u> : Afin de réduire le risque de thrombophlébite et d'invasion bactérienne dans le CVP in situ à court terme. Il est recommandé que le dispositif reste dans la veine 72 -96 heures maximum. (Réf. Atlanta CDC)

caracteristique p	nysique:
	Accès périphérique veineux à court terme. Dispositif pour cathétérisme par voie intraveineuse périphérique (PIC). Il est connecté à d'autres dispositifs (tels que perfuseur ou seringue) pour l'administration de produit. MOD.: NEO DELTA VEN.
PÉRIPHÉRIQUES INTRAVEINEUX CATHÉTER INTRAVASCULAIRE	Tubulure flexible RX-opaque avec canule, destinée à être placée dans l'accès veineux périphérique (extrémité distale du cathéter). Elle permet l'acheminement des liquides de perfusion au cours de l'administration (continue ou intermittente) ou le prélèvement de sang.
LIGNE RX -OPAQUE	La ligne radio-opaque est incorporée dans le matériau (PUR) afin que le sulfate de baryum (BaSO4) ne se

diffuse pas dans le sang du patient.

Elle permet d'extraire la canule de l'accès veineux, et de la tenir.

Elle permet de fixer et maintenir le cathéter correctement dans sa position, via une connexion Luer lock femelle et de le connecter à une perfusion pour l'administration continue ou intermittente des liquides et des médicaments ou pour être raccordé à une seringue de prélèvement d'échantillons de sang.

Conforme à EN ISO 10555-5, la couleur indique le diamètre de la jauge.

VANNE
D'INJECTION
Elle permet l'administration rapide de médicaments sans perforation.

FERMETURE DU
PORT
Variante présente uniquement sur les cathéters double entrée.
Variante présente uniquement sur les cathéters double entrée.
Il permet la fermeture de la connexion secondaire

Aiguille de cathéter conforme à la norme EN ISO 10555-5.

Permet l'insertion du cathéter dans l'accès veineux périphérique (ponction veineuse).

Aiguille Introductrice avec triple affûtage, atraumatique dit "BACK-CUT"

EMBASE AIGUILLE Permet d'extraire l'aiguille de la canule, en la tenant.

ATGUTLLE

INTRODUCTRICE

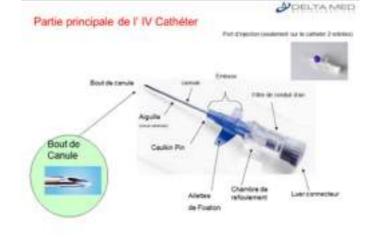

CORPS DU
RACCORD D'ÉVENT
AVEC FILTRE
RACCORD D'ÉVENT
PROTECTEUR

Il permet à l'aiguille de la canule d'être protégée.

Transparent et équipé avec un bouchon étanche, il permet un visuel rapide du retour veineux et le blocage d'une contamination externe de sang.

Il permet à l'aiguille de la canule d'être protégée.

CAPUCHON MÂLES Il permet la suspension momentanée du traitement par le biais de la fermeture hermétique de l'accès le plus proche de l'embout du cathéter.

Classification	Class II a (REF. MOD 93/42/CEE – APPENDIX IX) — Rule 7 Class II (RIF. CNDR SOR 98-292 – 3DHEDULE 1) — Rule 1 UMDNS: 10727 — Catheters, Intravenous, Peripheral CND (D.M. 20/02/2007): C0101010102 — Aghi cannula senza valvola d'iniezione C0101010101-Aghi cannula con valvola di iniezione COD. CATEG. REF. prEN1874: 10 — Disposable devices				
Definition	Short-term peripheral venous access. Device for peripheral intravenous catheterisation. Only in connection with other medical devices such as infusion set and/or needleless syringes containing a solution it permits the administration.				
Duration of contact	In order to reduce the risk of thrombophlebitis and bacterial invasion in the CVP in aits in the short term, it is recommended that the device stays in the vein 72-96 hours maximum. (Ref. Atlanta CDC)				

	PHYSICAL CHARACTERISTICS
CHARACTERISTIC	Short-term peripheral venous access. Device for peripheral intravenous catheterisation (PIC). Only in connection with other medical devices such as infusion set and/or needleless syringes containing a solution it permits the administration. MOD. NEO DELTA VEN.
PERIPHERAL INTRAVENOUS INTRAVASCULAR CATHETER	Rx-opaque flexible tube with cannula, intended to be placed in peripheral venous access (distal end of the Catheter). It allows the channelling of infusion liquids during administration (continuous or intermittent) or the channelling of blood.
RX-OPAQUE LINE	It allows the measurement of the incannulated catheter by X-rays. The radiopaque line is incorporated into the material (PUR) so that it is not possible the dispersion of BaSO4 into patient blood.
CATHETER HUB	It allows the cannula to be extracted from the venous access, supporting it. It allows the catheter to be fixed and correctly maintain its position, through a female Luer-Lock connection, and to connect it to an infusion set for the continuous or intermittent administration of liquids and medicines or to connect it to a blood sampling syringe. In accordance with EN ISO 10555-5, the colour countermarks the diameter of the Gauge.
INJECTION VALVE	Variant present only in dual entry catheters. It allows the rapid administration of medicines without perforation.
PORT CLOSURE	Variant present only in dual entry catheters. It allows the closure of the secondary connection.
INTRODUCER NEEDLE	Catheter needle conforms to the EN ISO 10555-5 standard. Allows the catheter to be inserted into the peripheral venous access (venipuncture). Introducer needle with triple sharpening, atraumatic
NEEDLE HUB	Allows the cannula needle to be extracted, supporting it.
VENT FITTING BODY WITH VENT FITTING FILTER	Transparent and equipped with a water-resistant stopper, allows both the rapid display of the venous return and the blocking of possible external blood contamination.
PROTECTOR	It allows the cannula needle to be protected.
MALE LUER LOCK CAP	It allows the momentary suspension of the treatment through the sealed closure of the nearest end (access) of the catheter hub.

Classification	Class II a (REF. MDD 93/42/CEE – APPENDIX IX) – Rule 7 Class II (RIF. CNDR SOR 98-282 – SCHEDULE 1) – Rule 1 UMDNS: 10727 – Catheters, Intravenous, Peripheral CND (D.M. 20/02/2007): C0101010102 – Aghi cannula senza valvola di inie COD. CATEG. REF. prEN1874: 10 – Disposable devices		
Definition	Short-term peripheral venous access. Device for peripheral intravenous catheterisation. Only in connection with other medical devices such as infusion set and/or needleless syringes containing a solution it permits the administration.		
Duration of contact	on of contact In order to reduce the risk of thrombophlebitis and bacterial invasion in the CVP in pitu in the short to it is recommended that the device stays in the vein 72-96 hours maximum. (Ref. Atlanta CDC)		

THIS DATA ARE APPLICABLE ALSO TO ONE WAY CATHETER WITHOUT WINGS

PRODUCTION METHOD

All the products are manufactured in compliance with the Legislative Decree 81/2008 and later updates as regards health and safety in the workplace and are manufactured in conformity with the company certified Quality System.

The parts used to manufacture the devices are produced using:

- moulding and extrusion (plastic parts of the catheters);
- > drawing, grinding, polishing (needles)

They are checked in terms of physical (visual and dimensional) and functional aspect according to European and international standards and internal Delta Med procedures.

These devices are packed into the Clean Room, During production physical and functional checks is done in accordance with European and international standards and internal procedures. The finished products are then packaged inside the Clean Room in strips made from thermoformable film and thermosealed medical grade paper and then EO sterilised by the external sterilizing company.

The products listed in this technical sheet are supplied in sterile form.

CLEAN ROOM ENVIRONMENT

The production is done in a Clean Room. The Clean Room, which is classified in accordance with European and international legislation EN ISO 14644-1 ISO CLASS 8, is periodically monitored, in "operational" state, with regards to the particulate and microbiological aspect and has the following properties:

- Particulate contamination: for particles ≥ 0.5 μ ≤ 3,520,000 m³
- Particulate contamination: for particles ≥ 5 μ ≤ 29,300 m³
- ➤ Aerobiocontamination: ≤ 200 UFC/m¹ in accordance with Eu GMPs Annex I (grade D)
- Biocontamination of surfaces: ≤ 21000 UFC/m² (50 UFC for plate Ø 55 mm) in accordance with Eu GMPs Annex I (grade D).

The access to the production area of materials and staff is done through a set of separate outer "lobbies". The hygienic rules and codes of conduct are observed by production staff and are shown in the access "lobbies" to the Clean Room.

Duration of contact	In order to reduce the risk of thrombophlebitis and bacterial invasion in the CVP in pitu in the short term, it is recommended that the device stays in the vein 72-96 hours maximum. (Ref. Atlanta CDC)		

CHECKS ON FINISHED PRODUCT

By statistical sampling, a series of visual, physical and functional checks are done on the finished product, in accordance with the internal procedures, which are divided up as follows:

- conformity check to the product specification;
- packaging and labelling check;
- visual check of the product;
- check of the distance between the end of the catheter and the beginning of the needle
- > penetration test
- > Pull test between catheter and catheter hub
- Pull test between needle and needle hub
- > Check of connections
- Injection valve leakage test (for dual entry catheters)
- Leakage test catheter hub with pressurised water

CHEMICAL AND BIOLOGICAL CHECKS

An external laboratory of analysis that has been authorised and approved performs the following chemical and biological checks:

- periodic sterility check: on a batch of packaging;
- biological indicators inactivation check: on every sterilisation batch;
- microbiological contamination check on products before sterilisation (Bioburden Test): periodically;
- > checking the absence of abnormal toxicity; done periodically on the product;
- > checking the presence of bacterial endotoxin (LAL Test): periodically on manufactured batch;
- chemical checks (reducing substances, acidity or alkalinity, residue on evaporation, spectrophotometric examinations); periodically;
- sterilisation residue check (EO, ethylene chloride, ethylene glycol) in products: done periodically and during the revalidation of the sterilisation process.

Duration of contact	contact In order to reduce the risk of thrombophiebitis and bacterial invasion in the CVP in altu in the short term it is recommended that the device stays in the vein 72-86 hours maximum. (Ref. Atlanta CDC)			

WARNING

Preventing the infections associated with the use of the intravascular catheters requires that strictly aseptic techniques and manoeuvres are adopted and observed during all the stages required: from the preparation (of the material, patient and personnel), to the insertion of the catheter, and the management of the catheter until it is replaced or removed.

Reconditioning and/or reusing the medical device – although not foreseen- could risk altering the device's performance and be dangerous due to contamination and infection caused by prior use by another patient.

PACKAGING AND STORAGE CONDITIONS

The primary packaging of the product is a thermoformed and thermo-sealed blister pack made of medical grade paper and plastic film.

The secondary packaging consists of a small cardboard box in cellulose, containing 50 pieces.

The transport packaging consists of corrugated cardboard of suitable dimensions for the content, containing 10 secondary packages (small boxes) equal to 500 pieces.

The opening of the primary packaging (strip) does not require the use of scissors or cutting tools. A nonsealed piece (Peel) actually allows the external packaging to be opened easily.

The opening of the secondary packaging in cardiboard also does not require the use of scissors or cutting tools as it is equipped with a tab that allows the easy opening and closure of the lid of the packaging.

As stated on the secondary packaging, the requirement for sterility is guaranteed when the packaging is integral therefore these <u>cannot be used</u> if there is any damaged packaging given that the product cannot be sterilised again.

BIOCOMPATIBILITY (ref. EN ISO 10993)

Introduction:

Given that this is an invasive surgical type device with the function of peripheral intravenous catheterisation, only in connection with other medical devices such as infusion set and/or needleless syringes containing a solution it permits the administration. The Catheter has biocompatibility requirements, with particular reference to the biocompatibility tests relative to the contact with the material (PUR) of the Catheter itself.

The duration of the contact is between 24 hours and 30 days. (Ref. EN ISO 10993-1).

> Catheter

The material used conforms to the chemical tests of the F.U.I. - Vol. I "Tubular apparatus for blood transfusion and fraction".

The biocompatibility tests performed on the Catheter were done in accordance with the harmonized series of standards EN ISO 10993 and were all passed with positive result.

> Needle

Conforms to the standard ISO 10555-5 and EN ISO 9626 for the pertinent aspects (smooth surfaces, free from roughness, cleaning), being a guide-needle and not a needle that is intended for the transfer of liquids and/or hypodermic needles.

Place and date of issue: Viadana (MN) 01 Semptemeber 2014
